Base station battery charging principle

Overview

Why do communication base stations use battery energy storage?

Meanwhile, communication base stations often configure battery energy storage as a backup power source to maintain the normal operation of communication equipment [3, 4]. Given the rapid proliferation of 5G base stations in recent years, the significance of communication energy storage has grown exponentially [5, 6].

What is a base station energy storage system?

A single base station energy storage system is configured with a set of 48 V/400 A-h energy storage batteries. The initial charge state of the batteries is assumed to obey a normal distribution, assuming that the base station has a uniform specification and its parameters are shown in Table 2. Table 2. Parameters of the energy storage system.

How does a virtual battery control a base station?

By regulating the charging and discharging behavior of the virtual battery of the base station in such a way that the base station avoids the peak period of power consumption and staggered power preparation, it is able to optimize the regional demand for electricity.

Can a virtual battery model be used for a base station?

Grounded in the spatiotemporal traits of chemical energy storage and thermal energy storage, a virtual battery model for base stations is established and the scheduling potential of battery clusters in multiple scenarios is explored.

What is the charging and discharging capacity of a battery pack?

The charging and discharging capacity of the battery pack in the base station energy storage system can be described as Equation (10): and are the current charging power and discharging power of the battery, respectively, and is an operating cycle.

What is the function of battery pack in energy storage?

The battery pack in the energy storage section has the capacity to absorb energy as a load, thereby increasing the power consumption of the grid during the trough period. It can also release energy to reduce the overall power consumption of the base station, thus balancing the high load of the grid during the peak period.
