Communication base station inverter honeycomb structure

Overview

What is 5G honeycomb structure design?

It can be said that the key idea of 5G honeycomb structure design is mainly to divide the indoor and outdoor scenes, the purpose of which is to avoid the penetration loss of the building wall to the signal.

What is a communication base station?

In the vast telecommunications network, communication base stations play a frontline role. Positioned closest to end users, they serve as gateways for processing customer requests and managing data flow. In the words of "Interesting Communication Engineering Drawings," these stations act like "business trackers," always vigilant to:

How can BS antenna array be installed outside a building?

An external base station or a BS distributed antenna array will be installed outside each building, and the large antenna array can be directly connected to the wireless access point and the indoor user communication facility in the building through the cable, which can be used in the short-term operation.

What is Ericsson antenna system?

Antennas are a key part to this puzzle, and Ericsson Antenna System creates precise engineered antennas that serve as a gateway to higher performing, more energy efficient networks. New honeycomb structure launch video | 0:41 min.

How can a BS antenna be connected to an outdoor base station?

The antenna array provided in the cell can be connected to the BS by means of an optical fiber through the application of the outdoor base station, and can form a virtual large-array antenna on the basis of the above.

What is a base station connection diagram?

The connection diagram provides a clear overview of how the main base station equipment operates within the network. Surrounding this central "brain" are the "Four Guardians" that ensure seamless functionality: Power Supply: Provides a steady and uninterrupted energy source to keep the equipment operational.
