Container energy storage battery temperature control system

Overview

The existing thermal runaway and barrel effect of energy storage container with multiple battery packs have become a hot topic of research. This paper innovatively proposes an optimized system for th.

What is a containerized energy storage battery system?

The containerized energy storage battery system comprises a container and air conditioning units. Within the container, there are two battery compartments and one control cabinet. Each battery compartment contains 2 clusters of battery racks, with each cluster consisting of 3 rows of battery racks.

What are the characteristics of a battery storage system?

The internal resistance remains unchanged during battery discharge [38, 39]; (3) The walls of the container do not transfer energy and matter to the outside world, and are considered adiabatic and non-slip wall; (4) The source of cooling air is stable and continuous, and the energy storage system operates under stable conditions.

What is a containerized storage battery compartment?

The containerized storage battery compartment is separated by a bulkhead to form two small battery compartments with a completely symmetrical arrangement. The air-cooling principle inside the two battery compartments is exactly the same.

What is the maximum temperature of a battery pack?

However, due to the poor airflow circulation at the top of the container, temperature unevenness still exists inside the battery pack, with the maximum temperatures of 315 K and 314 K for the two solutions. Both optimized solutions 3 and 4 belong to the type of airflow organization with central suction and air blowing at both ends.

What are the functions of the energy storage system?

The energy storage system supports functions such as grid peak shaving, frequency regulation, backup power, valley filling, demand response, emergency power support, and reactive power compensation. The 2.5MW/5.016MWh battery compartment utilizes a battery cluster with a rated voltage of 1331.2V DC and a design of 0.5C charge-discharge rate.

Can a multidimensional thermal environment be regulated in a containerized energy storage unit?

High-fidelity numerical simulations were employed to perform multiphysics-coupled analysis of the thermal dynamic characteristics within the energy storage unit. This approach thereby enabled the multidimensional regulation of the internal thermal environment in containerized ESS.
