Distributed solar energy storage costs

Overview

We are pleased to announce the release of the latest edition of Berkeley Lab's Tracking the Sun annual report, describing trends for distributed solar photovoltaic (PV) systems in the United States, including the growing contingent of distributed solar-plus-storage systems.

We are pleased to announce the release of the latest edition of Berkeley Lab's Tracking the Sun annual report, describing trends for distributed solar photovoltaic (PV) systems in the United States, including the growing contingent of distributed solar-plus-storage systems.

Battery storage attachment rates continue inching upwards. In 2023, 12% of all new residential PV installations and 8% of all non-residential installations included battery storage. As usual, Hawaii was in a category of its own, with residential and non-residential storage attachment rates of 95%.

The US solar industry installed 7.5 gigawatts direct current (GW dc) of capacity in Q2 2025, a 24% decline from Q2 2024 and a 28% decrease since Q1 2025. Solar accounted for 56% of all new electricity-generating capacity added to the US grid in the first half of 2025, with a total of 18 GW.

There is economic potential for up to 490 gigawatts per hour of behind-the-meter battery storage in the United States by 2050 in residential, commercial, and industrial sectors, or 300 times today's installed capacity. But only a small fraction could be adopted by customers, according to the latest.

SPRINGFIELD — Illinoisans could see a new line item on their electric bills under a bill passed Wednesday night by the Illinois House. Under the proposal, contained in an amendment to Senate Bill 25, ratepayers will subsidize energy storage projects like large battery installations. Environmental.
