Flow Battery Rebalancing

Overview

Do sealed flow batteries have internal rebalancing?

In the case of sealed systems with internal rebalancing, the balance can be fully restored so that in principal, steady-state operation can be achieved. Development of sealed flow batteries with internal rebalancing is thus an important step toward the ideal "maintenance-free" operation.

What are the principles of sealed iron flow batteries?

Abstract Principles of sealed iron flow batteries are introduced and a semi-empirical model that incorporates the hydrogen evolution reaction and electrolyte rebalancing is developed. Hydrogen generation rates are measured using pressure measurements in sealed vessels.

Is automatic electrolyte rebalancing possible for VRFB capacity recovery?

To address these challenges, a design involving a hydraulic shunt tube connecting the two electrolyte tanks was proposed to achieve automatic electrolyte rebalancing for VRFB capacity recovery without the need for periodic remixing or additional formation charge processes [17, 31].

Do hydrogen side-reactions cause electrolyte imbalance in all-iron flow batteries?

Conclusions Hydrogen side-reactions lead to an electrolyte imbalance in all-iron flow batteries, and this occurs simultaneously for iron and hydrogen species. Fortunately, this problem can be corrected using an appropriate rebalancing system.

Does asymmetric auto-rebalancing achieve high capacity retention and high efficiency?

This study introduces an innovative electrolyte-rebalancing technique named asymmetric auto-rebalancing (AAR) to achieve high capacity retention and high efficiency of VRFBs during long-term operation. Three VRFBs—one each

without rebalancing (NR), with auto-rebalancing (AR), and with AAR—were prepared for a performance comparison.

Do aqueous flow batteries produce hydrogen?

As with some other aqueous flow batteries, they can experience significant rates of hydrogen generation (ca. 1–10% of the nominal operating current density). This hydrogen evolution represents a loss of protons from the electrolyte and it also leads to a chemical imbalance with each charge-discharge cycle.
