Hybrid energy for communication base stations in Chile

Overview

Are base transceiver stations environmentally friendly?

The only electrical source currently in service in the Base Transceiver Stations (BTS) is a diesel generator. As a result, diesel generators are not economical and are not environmentally friendly. Therefore, these sites must integrate sustainable energy sources like wind and solar [4].

What is a base transceiver station?

The base transceiver station is one of the main components of cell sites that consume energy. Diesel fuel purchases for generators, which make up over 80 % of plant-level energy expenditures at off-grid and off-grid tower sites, are the primary source of these costs.

How do hybrid systems work?

The hybrid systems are designed with circuits, simulated, and compared to show their good performance to the base stations. PSIM, PROTEUS, and MATLAB software are used to simulate for evaluating the voltage and the current output of the hybrid systems that meet the power requirements.

Why do we need a hybrid energy system?

Promoting equality and employment creation can also improve the region's social and environmental characteristics. A hybrid energy system will assure energy security and reliability, especially when it has a variety of various heterogeneous energy supplies.

Are hybrid BTS sites good for Pakistan's telecom industry?

Hybrid BTS sites are, therefore, more economical and environmentally friendly regarding worries about global warming and long-term system functioning with no pollution. In conclusion, building improved BTS sites has positive technical, environmental, and financial effects on Pakistan's telecom industry.

What is a Base Transceiver Station (BTS)?

Existing and proposed Base Transceiver Stations (BTS) design framework The only electrical source currently in service in the Base Transceiver Stations (BTS) is a diesel generator. As a result, diesel generators are not economical and are not environmentally friendly.
