Abstract: This paper deal with Electric vehicle DC motor which is powered by hybrid energy storage system using ultra capacitor and Lithium-Ion battery. Depending on the battery capacity, a battery may extend the all-electric range, but in heavily loaded situations, its efficiency is reduced.

The DC motor controller powered by lithium batteries stands out as a significant innovation, merging efficiency, power, and sustainability. This guide explores the mechanics, benefits, and applications of this technology, providing an in-depth understanding of its impact on modern motorized.

The market for battery powered motor driven products is growing rapidly with the introduction of brushless motors and Li-ion batteries used primarily to extend operating time. Examples of traditional markets that are upgrading to these new devices include battery powered tools (drills, chainsaws).

DC motor controllers regulate power flow from lithium batteries to motors using PWM (Pulse Width Modulation) to adjust speed/torque. They convert battery DC voltage into variable current, matching motor demands while protecting against overcurrent/overvoltage. Modern controllers integrate with BMS.
