# Safe distance between lithium battery station cabinet and equipment

## Overview

---

- The distance between battery containers should be 3 meters (long side) and 4 meters (short side). If a firewall is installed, the short side distance can be reduced to 0.5 meters. • Per T/CEC 373-2020, battery containers should be arranged in a single-layer configuration.

sted to UL 9540. According to UL 9540 the separation between batteries should be 3ft (91.4 cm). UL 9540 also provides that equipment evaluated to UL 9540A with a written report from a nationally recognized testing laboratory (NRTL), such as ETL, can be permitted to be installed with less than 3ft.

The primary function of a battery cabinet is to safely store and charge lithium-ion batteries under controlled conditions. These cabinets act as passive and active safety systems, ensuring that batteries are isolated, ventilated, and, if necessary, extinguished automatically in case of an internal.

Like all batteries, lithium battery cells contain a positive electrode, a negative electrode, a separator, and an electrolyte solution. Atoms or molecules with a net electric charge (i.e., ions) are transferred from a positive electrode to a negative electrode through an electrolyte solution.

According to OSHA, batteries must be stored in a cool, dry, and well-ventilated area to prevent overheating and potential reactions. They've be separated by type and labeled properly to avoid harmful interactions. The storage area should be free from combustible materials and incompatible.

NFPA 70E ®, Standard for Electrical Safety in the Workplace®, Chapter 3 covers special electrical equipment in the workplace and modifies the general requirements of Chapter 1. The chapter covers the additional safety-related work practices necessary to practically safeguard employees against the.
