Solar grid-connected solar panels

Overview

In a grid connected PV system, also known as a “grid-tied”, or “on-grid” solar system, the PV solar panels or array are electrically connected or “tied” to the local mains electricity grid which feeds electrical energy back into the grid. What is a grid connected solar system?

Components and Prices Explained A solar system connected to the utility grid through a bi-directional net meter is known as a grid-connected PV system. It is known by various names, including a grid-connected energy system, a grid-tied solar system, and an on-grid solar system.

What is a grid connected PV system?

Grid connected PV systems always have a connection to the public electricity grid via a suitable inverter because a photovoltaic panel or array (multiple PV panels) only deliver DC power. As well as the solar panels, the additional components that make up a grid connected PV system compared to a stand alone PV system are:.

How do I connect solar panels to the grid?

To connect solar panels to the grid, you need to install a bi-directional meter on your home. This allows energy produced by your solar panels to be fed into the grid when you're not using it, and for you to draw energy back from the grid when you need it.

Should you connect solar panels to the electrical grid?

Connecting solar panels to the electrical grid is one of the most effective ways to maximize your solar investment while maintaining reliable power. Grid-tied solar systems allow you to use solar energy during the day, sell excess power back to the utility through net metering, and draw from the grid when needed.

What are the different types of grid-connected solar systems?

Primarily, there are two types of grid-connected solar systems, explained below: On-grid systems: In this type, the solar system is integrated with a grid. The structure is similar to traditional electricity infrastructure. It is the most popular and widely trusted grid-connected PV system available in the market.

How does a grid tied solar system work?

This connection allows your solar system to share excess energy with the grid when your system produces more electricity than you need. It also enables you to draw power from the grid when your solar panels aren't producing enough energy—such as at night or on cloudy days. The Basic Components of a Grid-Tied Solar System
