Temperature measurement of communication base station inverter

Overview

Why is temperature control important in unattended mobile base stations and cell towers?

Due to the limited access for repair and maintenance of base station and cell towers, long life operation is required. Temperature control of sensitive telecom electronics in unattended mobile base stations and cell towers is vital for the operation of primary and back-up systems.

Can a bus bar cooling system be designed into an inverter system?

For example, bus bar cooling can be designed into an inverter system using a custom-designed cold plate. • Every inverter is unique, which makes it difficult to develop cooling strategies that are applicable to all inverters. We are working to develop thermal management concepts that are applicable to a wide range of inverter designs.

Why is thermal management important for inverters?

- Every inverter is unique, which makes it difficult to develop cooling strategies that are applicable to all inverters. We are working to develop thermal management concepts that are applicable to a wide range of inverter designs. Supports transition to high-efficiency WBG devices in automotive power electronics.

How to measure junction temperature of IGBT modules?

There are four main methods for monitoring the junction temperature of IGBT modules: optical measurement , physical contact , , thermal modeling , and temperature-sensitive electrical parameter measurement , , .

What is the importance of temperature control in Telecom?

Temperature control of sensitive telecom electronics in unattended mobile base stations and cell towers is vital for the operation of primary and back-up systems. Heat can significantly degrade the performance and operating life of

telecom cabinets, energy storage systems and back-up battery systems.

What is the most widely used junction temperature monitoring method?

2.3. Thermal network model This article chose the Infineon FZ1500R33HE3 (3300 V/1500 A) IGBT module as the research object, and adopted the most widely used junction temperature monitoring method, the thermal network model method, based on the principle of thermoelectric analogy.
