The distance between New Zealand energy storage power station and buildings

Overview

How far away should a building be from a power line?

All work must be a safe distance away from overhead lines. The minimum distance between a structure and an overhead line varies depending on the voltage the line is carrying. The structure needs to be clear of lines both underneath and to the side. Learn the essential safety guidelines for building near power lines.

How do I find a power line company in New Zealand?

Check the surrounding under or near power lines, poles, wires or other electricity network equipment. 0800 Powerco 0800 769 372 if your work is in our network area and we'll help you with your plans. If your work is outside our area, it's best to contact your local electricity lines company. See a map of New Zealand lines companies.

How far above ground should a stay wire be from a telecommunications line?

minimum vertical distance above the ground of 5.5 m. 7.2.4 Stay wires shall not be less than 300 mm from any bare telecommunications line. any person without the use of a climbing device. than 3 m above ground level. allow safe and unobstructed egress in emergency situations. unobstructed passageway at least 1 m wide and 2.5 m high.

Should I erect a building under a power line?

If you are erecting a building, including decking, under or near any power lines, seek advice from your electrician or us. If there is a need to alter the lines, consider having them placed underground. This will be much safer for you and will also improve the aesthetics of the property.

Is nuclear power used in New Zealand?

Nuclear power is not used in New Zealand. Source: First power station owned by government. Dismantled in 1941. Dam used as popular swimming spot.

Decommissioned due to lightning strike damage. Believed to be the oldest hydro electric power station in the world that still operates.

What are the different types of power plants in New Zealand?

Power plants in New Zealand have different generating roles – for baseload, intermediate or peaking. Baseload generators are those that run continuously (except for maintenance), and include all geothermal and run-of-the-river hydroelectric plants, which must 'use it or lose it'. Intermediate generators are load-following power plants.
