The role of the thermostat in the inverter of the communication base station

Overview

Thermoelectric cooler assemblies, which utilize thermoelectric coolers, are compact, efficient units that can control the temperature in mobile base stations and cell towers.

Unattended base stations require an intelligent cooling system because of the strain they are exposed to. The sensitive telecom equipment is operating 24/7 with continuous load that generates heat. Cooling systems must protect critical telecommunication cabinets, energy storage systems and back-up.

The utility model discloses a temperature control system of a communication base station. The temperature control system comprises a machine room, a plurality of axial flow fans, a storage battery, a thermostat, a controller and communication equipment; the axial flow fans, the storage battery, the.

The temperature control equipment inside the communication base station includes four categories: inlet air unit, outlet air unit, temperature sensor and temperature controller. The inlet fan is responsible for the introduction of outdoor cold air, and the outlet fan is responsible for discharging.

The present-day tele-space is incomplete without the base stations as these constitute an important part of the modern-day scheme of wireless communications. They are referred to as cell towers or cellular antennas. These types of objects are an inevitability since they serve the purpose of.

The following are some specific applications of inverters in communication base stations: Power conversion and adaptation: The inverter converts DC

power (such as batteries or solar panels) into AC power to adapt to the power needs of various communication equipment. This is critical to ensure.
