Wind power standard limits for communication base stations

Overview

What is the emission bandwidth limit for a base station?

(3) Fixed and base stations transmitting a signal with an emission bandwidth greater than 1 MHz must not exceed an ERP of 1000 watts/MHz and an antenna height of 305 m HAAT, except that antenna heights greater than 305 m HAAT are permitted if power levels are reduced below 1000 watts/MHz ERP in accordance with Table 3 of this section;.

Are cellular tower antennas able to withstand wind loads?

As tower space becomes increasingly scarce and some infrastructure pushes its limits, the demand for antennas that can better withstand wind loads is more crucial than ever. Andrew's re-designed base station antennas are crafted to be exceptionally aerodynamic, minimizing the overall wind load imposed on a cellular tower or similar structures.

How do we reduce wind load in base station antennas?

To reduce wind load in base station antenna designs, the key is to delay flow separation and reduce wake. This equation can be simplified, as only the third term on each side is related to pressure drag. Furthermore, force is related to pressure: How do we reduce wind load for base station antennas?

.

Which wind direction should be considered in a base station antenna?

In aerospace and automotive industries, only unidirectional wind in the frontal direction is of concern. In the world of base station antennas, wind direction is unpredictable. Therefore, we must consider 360 degrees of wind load. Wind force on an object is complex, with drag force being the key component.

How much power does a licensee need to operate a base station?

(3) A licensee operating a base or fixed station in the 2110-2155 MHz band

utilizing a power greater than 1640 watts EIRP and greater than 1640 watts/MHz EIRP must coordinate such operations in advance with all Government and non-Government satellite entities in the 2025-2110 MHz band.

What are the requirements to operate a WCS station?

(b) WCS licensees operating base and fixed stations in the 2305-2320 MHz band must, prior to operation of such stations, achieve a mutually satisfactory coordination agreement with the National Aeronautics and Space Administration (NASA) within 145 kilometers of the Goldstone, CA earth station site (35°25'33" N, 116°53'23" W).
